mi-eye is an in-office diagnostic arthroscopy that allows for immediate answers to your pain.

mi-eye is indicated for use in diagnostic and operative arthroscopic and endoscopic procedures to provide illumination and visualization of an interior cavity of the body through either a natural or surgical opening. mi-eye is available for prescription use only.

Unlike a traditional diagnostic arthroscopy, the mi-eye procedure is done while you remain awake using a local numbing of the joint. The needle and camera design streamlines the procedure allowing you to get answers to your joint pain in the first office visit.

### How it Works

- + Your doctor will clean and sterile prep the procedure site. Patients with an active infection should not have a mi-eye procedure.
- + Local anesthetic is provided to numb the skin and surrounding area to reduce pain.
- + Once the joint is numb, your doctor will re-prep the area and insert the mi-eye into the joint.
- + During the procedure, your doctor will examine your joint for possible injuries giving you a real-time view and diagnosis with little to no pain.
- + After the procedure, the area is covered with a bandage and you are able to return to normal activities with an immediate answer and established treatment plan for your joint pain.

**Get back to your active life 2 weeks sooner\* with a mi-eye than a traditional MRI**

\*Based on estimated time-frame from radiology testing and results, including follow-up consultation.
